

3. Project Design Phase

The project design phase focuses on designing the structure of the Auto Ticket Classification using Flow Designer system based on the identified requirements.

The system is designed to store ticket information in a structured table and automatically classify tickets based on the issue description. A custom table named Incident Workflow is created to store the ticket records. [?](#)

Table and Field Design

The main fields designed for the ticket table are:

Number – Auto Number

Caller – Reference to user

Category – Choice field

Subcategory – Choice field

Short Description – String

Description – String

State – Choice field

Assigned Group – Reference field

Assigned To – Reference field [?](#)

Category and Subcategory Design

A dependency is designed between Category and Subcategory. When a category is selected, only the related subcategory options are displayed.

For example:

Network → Wi-Fi

Hardware → Projector

Access → Forgot Password

Performance → Slow Computer ?

Automation Design

The project is also designed with a Flow Designer automation. When a new ticket is created, the flow checks the short description for predefined keywords and automatically updates the Category and Subcategory. ?

Outcome:

The project design provides a structured ticket table, appropriate fields, dependent choices, and an automation structure for automatic ticket classification.
