

## 2. Requirement Analysis Phase

The requirement analysis phase was carried out to understand the existing school IT helpdesk process and identify the requirements for automating ticket classification.

The school IT helpdesk receives support requests from students and teachers related to network connectivity, hardware failures, account access problems, and system performance issues. Currently, IT staff manually review each ticket, identify the issue type, select the appropriate category and subcategory, and inform the caller about ticket creation. This manual process is time-consuming and may become difficult to manage when the number of requests increases. [?]

### Business Requirements

The proposed system must:

Automatically classify IT tickets based on the issue description.

Assign Category and Subcategory without manual intervention.

Support dependent selection between Category and Subcategory.

Send an automated email notification to the caller after ticket creation.

Store ticket information in a structured and standardized format.

Provide easy maintenance and future scalability. [?]

Auto Ticket Classification using Flow Designer.pdf

### Functional Requirements

The system should accept the caller and ticket description.

The system should identify keywords from the ticket description.

It should automatically assign the relevant Category.

It should automatically assign the relevant Subcategory.

It should send an email confirmation to the caller.

Expected Categories

Category

Subcategory

Network

Wi-Fi

Hardware

Projector

Access

Forgot Password

Performance

Slow Computer

These category and subcategory relationships are defined in the project requirements and dependency configuration. [?](#)
